Your Last Pentest Is Already Outdated

The Case For
Continuous Purple Teaming

Cas van Cooten

CyberSec NL - 2026

Who am I?

- Experienced ethical hacker and offensive security enthusiast
- Conference speaker on offensive security and building security tools
- Former: External Red Team @ Deloitte
  → internal Red Team @ ABN AMRO
- Current: Co-Founder & Tech Lead at **Offensys**: the platform for Continuous Purple Teaming

Cas van Cooten

Offensys Co-Founder
& Tech Lead

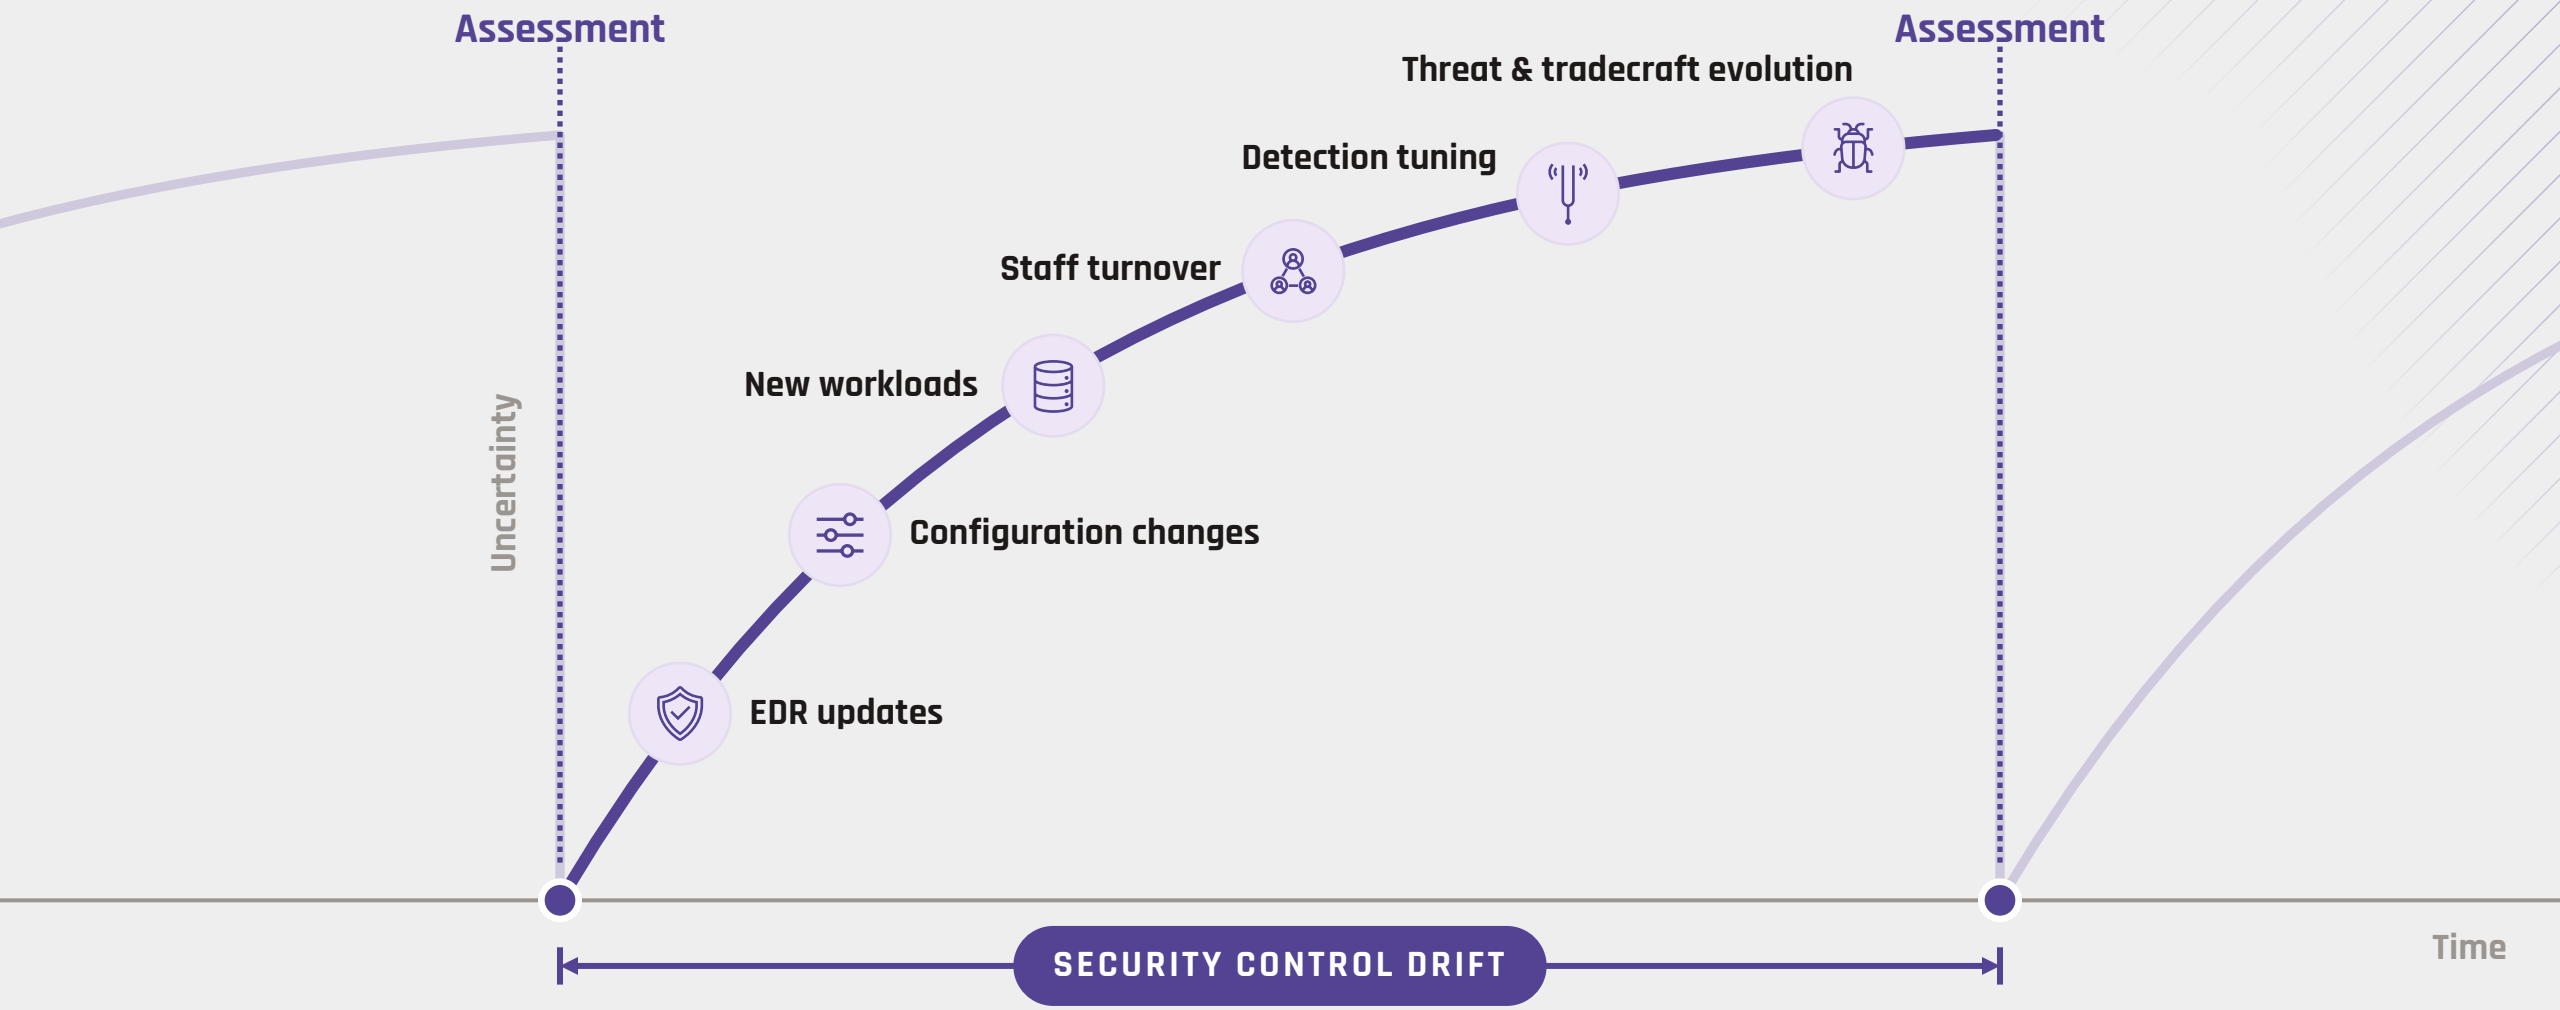

OFFENSYS

Attackers iterate in hours.

You validate once a year.

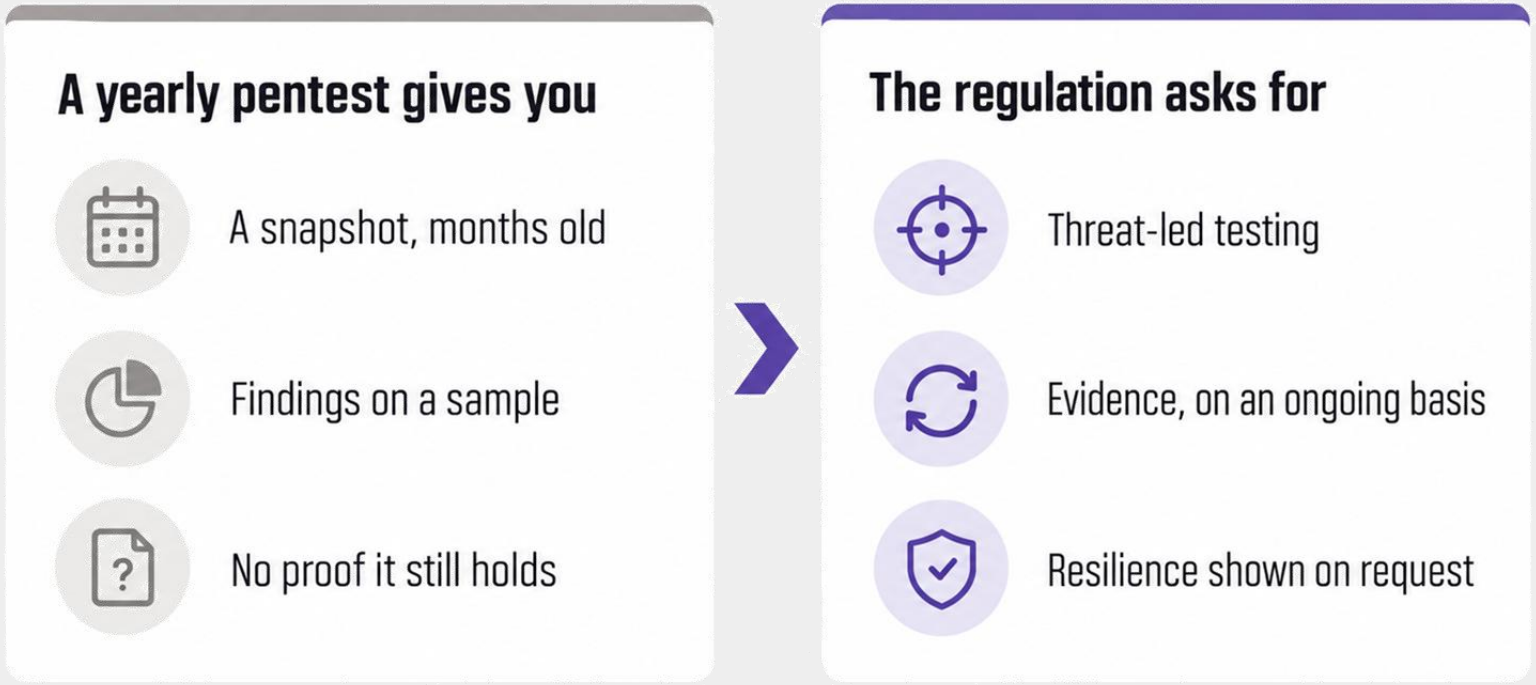

The problem with point-in-time assessments

Between two assessments, every change can silently break a control that you believed worked

Regulators now ask for proof, not a report

DORA and NIS2 expect you to demonstrate that controls work now, not that they were tested once.

See: DORA Art. 24-26, NIS2 Art. 21

What is (Continuous) Purple Teaming?

Continuous Purple Teaming brings together offense and defense in an ongoing capability

Red Team

The Offense

Emulates adversary TTPs to expose exploitable gaps across people, process, and technology.

TRADITIONAL

Purple Team

The Collaboration

Offense and Defense collaborating in full transparency: red runs simulations and provides offensive insight, while blue hunts and improves control posture.

Blue Team

The Defense

Prevents, detects, and responds, continuously improving identify gaps and turn them into measurable gains in visibility and control.

What is (Continuous) Purple Teaming?

Continuous Purple Teaming brings together offense and defense in an ongoing capability

The Gartner Solution:

> **Adversarial Exposure Validation (AEV)**
>
> **Consistent, continuous and automated** evidence of attack feasibility, via **automated execution** of attack scenarios.

What is (Continuous) Purple Teaming?

Continuous Purple Teaming brings together offense and defense in an ongoing capability

The Gartner Solution:

Adversarial Exposure Validation (AEV)

Consistent, continuous and automated evidence of attack feasibility, via **automated execution** of attack scenarios.

The Implementation:

Continuous Purple Teaming (CPT)

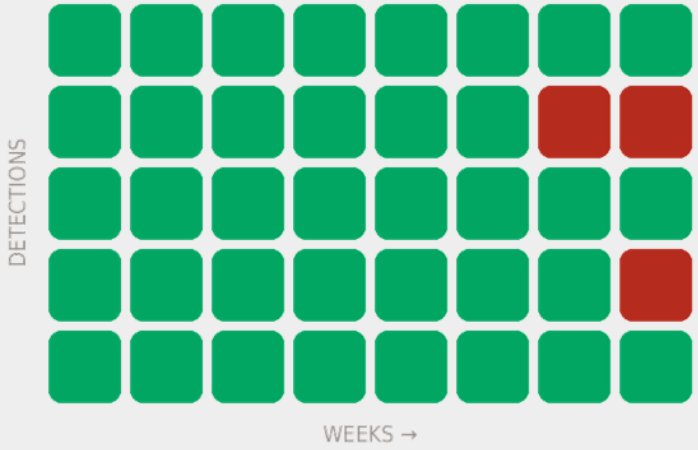

Continuous Purple Teaming is AEV with an emphasis on insight for the blue team: every simulation feeds a **continuous feedback loop** that measurably improves prevention and detection.

The CPT feedback loop

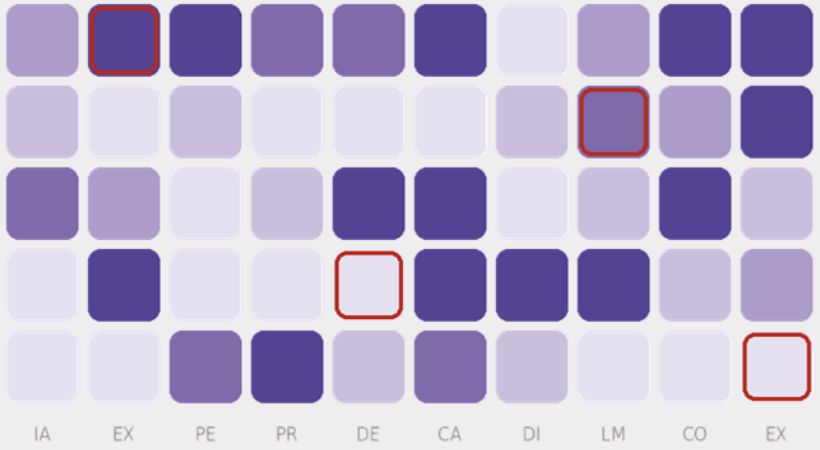

Simulate - Two directions of validation

BOTTOM-UP: DID ANYTHING BREAK?

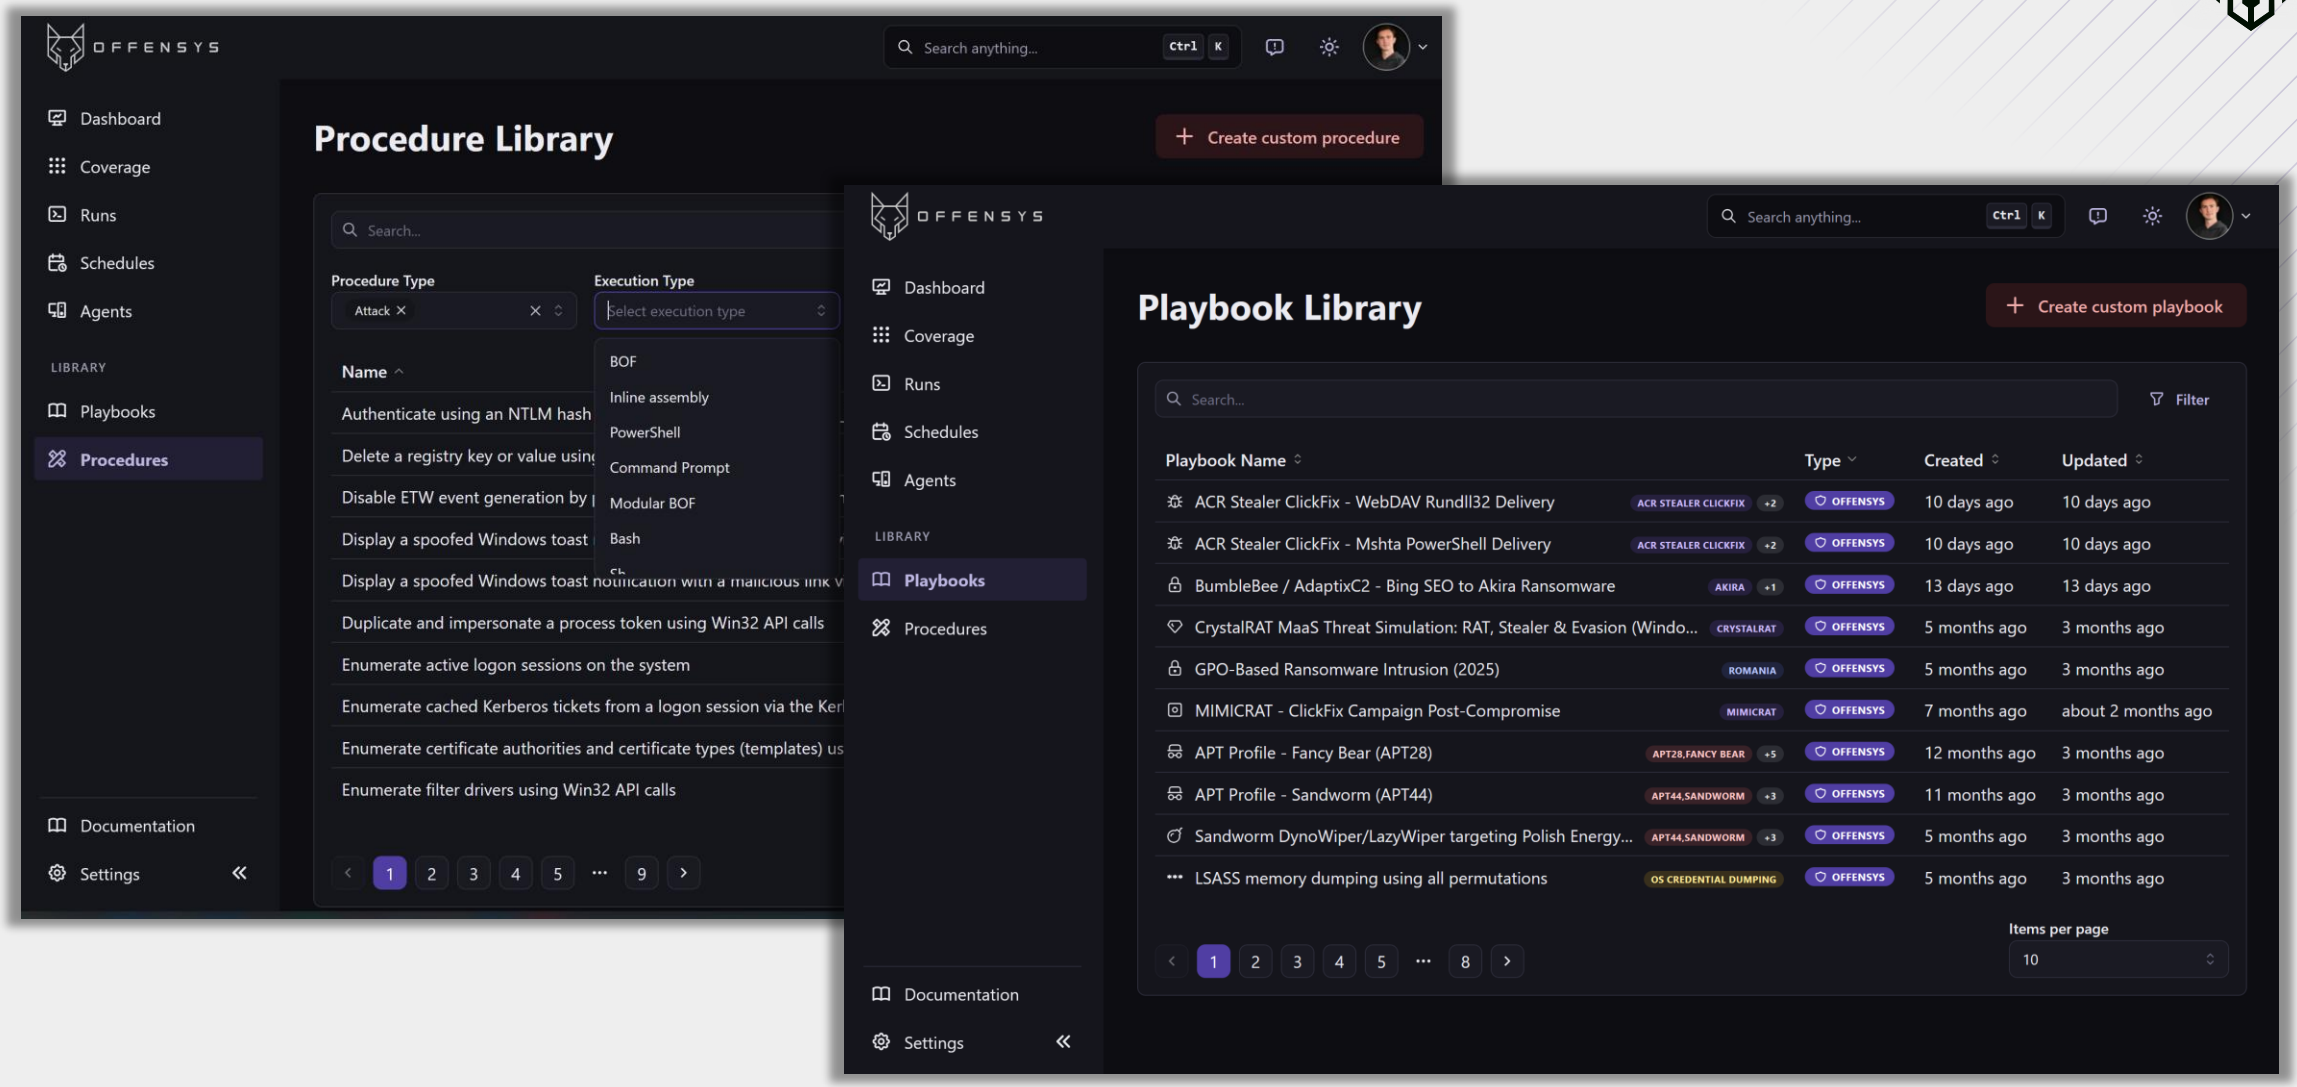

Same simulation, every week.

TOP-DOWN: ARE WE COVERED?

Coverage of your threat profile on MITRE ATT&CK.

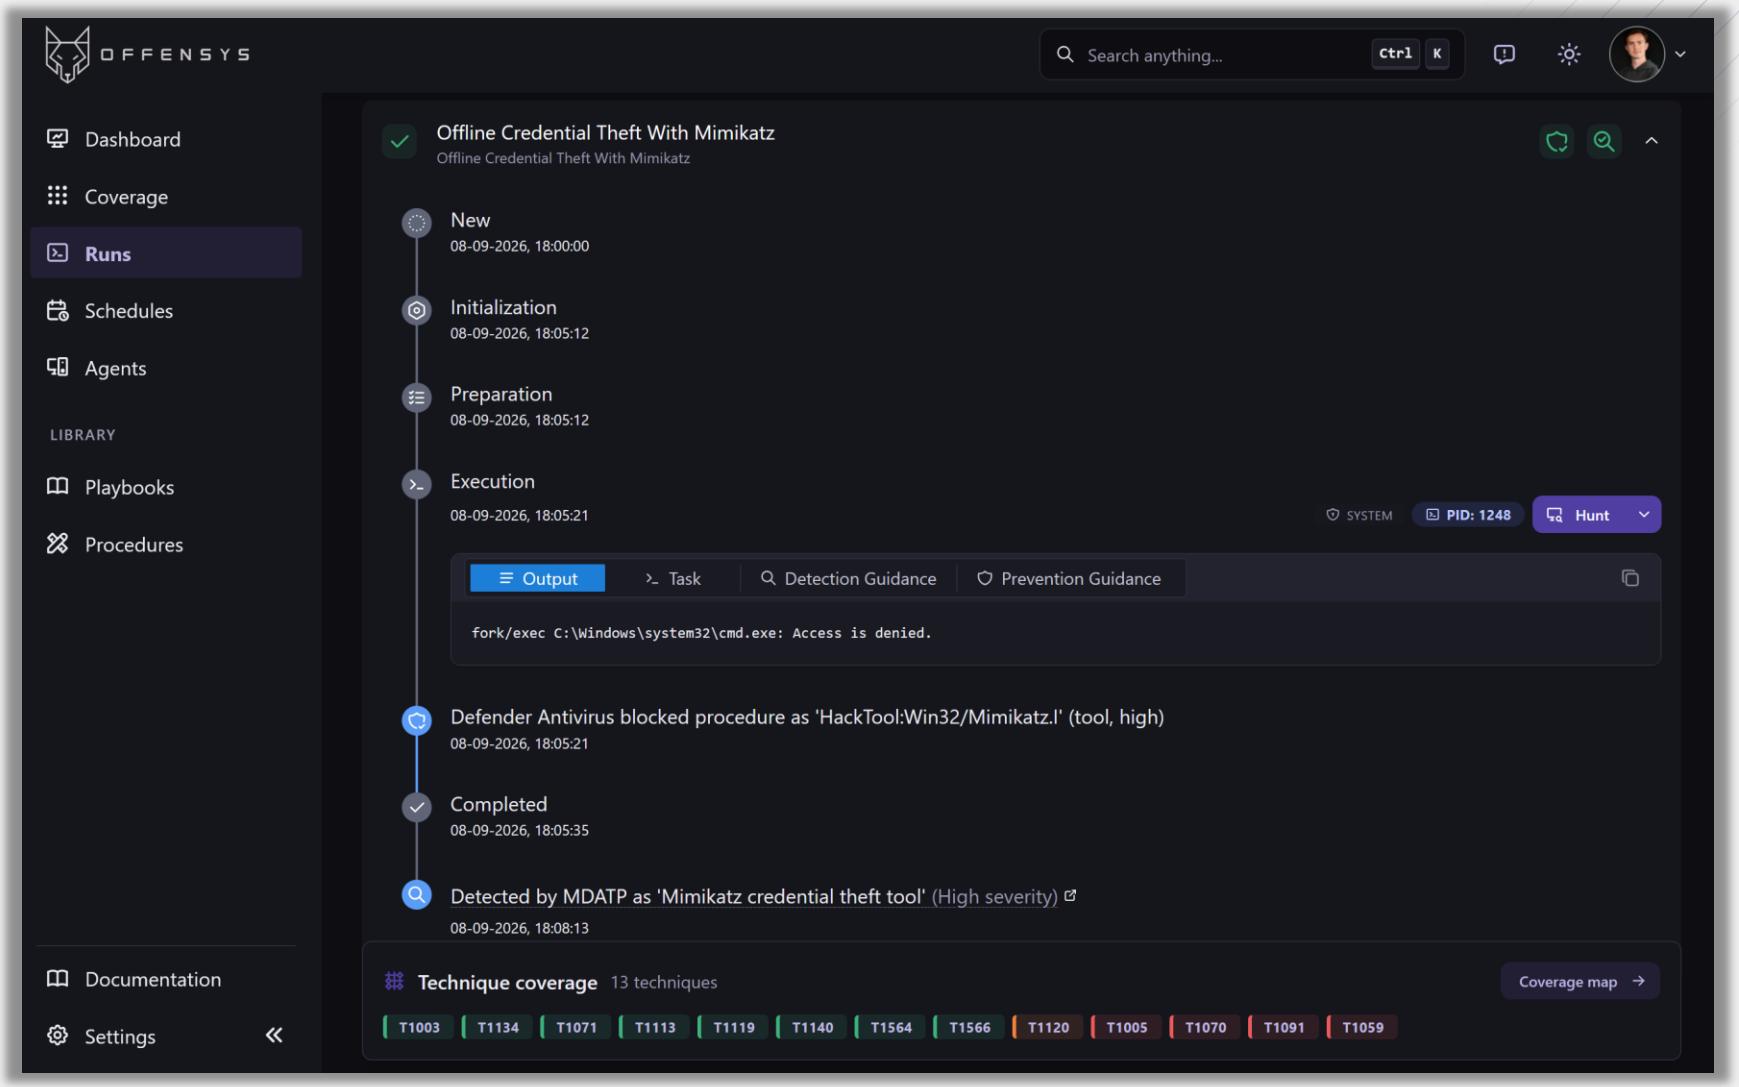

Simulate – The Offensys attack library

The CPT feedback loop

Measure – Offensys execution and correlation

The CPT feedback loop

Prioritize – Offensys continuous insight

CPT use cases across the security organization

SECURITY EXECUTIVES

"How do I prioritize what to fix, and how do I measure and prove the ROI of what we've invested in?"

SECURITY OPERATIONS / MSSP

"How do I know my controls didn't regress since last week?"
"How do I hold my MSSP to a measurable standard?"
"How do I efficiently engineer a detection for a new technique?"

OFFENSIVE SECURITY

"How do I scale my expertise and stop manually repeating the same simulations across every engagement?"

Three questions to ask your team tomorrow

1. Are we really protected against the threats that matter to us?
2. Could we prove our control effectiveness to a regulator today?
3. Do the controls we implemented yesterday still work today?

If any answer is "we don't know", that is the case for continuous purple teaming

OFFENSYS

Thank you!
